PRODUCT REQUIREMENTS AND BUILD PLAN

Website + Owner Portal

A functional scope for evolving the existing Verimarts website into a multi-category public marketplace with a private, single-owner management portal.

1. Product structure

Keep the existing website, layout, brand, logo, palette, and visual quality. Expand the content architecture to support product and property categories plus published writing. Add a separate private owner portal in the same project/repository, deployable on a portal subdomain and connected to the same backend.

Public storefront: discovery and enquiries. Owner portal: content management. One owner account. No customer checkout or multi-vendor features.

2. Public website pages

Page	Purpose and key sections
Home	Preserve the existing design. Add a clear marketplace hero, category navigation, featured listings across selected categories, a prominent Farm & Produce feature, Journal preview, trust/intro sections, and contact CTA.
Shop All	Browse active sale listings across product categories; search by keyword, filter by category/price/availability, and sort. Property may have its own browse view or be included under the category navigation.
Cars	Vehicle catalogue with make/model/year, price, photos, key specifications, condition notes, and availability when known.
Property	Property listings with photos, location, type, price, and confirmed features. Do not label as rent or sale unless the owner supplies that status.
Farm & Produce	Dedicated agricultural category with product/produce name, images, unit or quantity, price, availability, and details provided by the owner. Give this category strong visibility.
Electronics	Electronics and appliance catalogue with brand/model, condition, price, product images, and available specifications.
Other Goods	General merchandise/supermarket-style items with product description, price, photo, category, and status.
Journal	Public reading experience for approved writing: article list, title, cover image, publish date, category, and readable article detail page. “Verimarts Journal” is a working label.
About / Contact	Use accurate business information. Contact actions include WhatsApp/phone/email only when supplied; do not invent location, services, or business claims.

3. Public marketplace behaviour

- Public visitors can browse and search without signing in.
- Only listings marked published and available for public display appear in public catalogues.

- Each listing has a detail view and clear contact/enquiry action to the owner.
- WhatsApp can open a prefilled message identifying the item; use a central contact configuration value.
- No add-to-cart, buy-now checkout, reservation, payment, order form, or customer account.
- For writing, readers can open and read a published article; no comment system unless separately approved.
- If a record has missing details, omit those fields or label them clearly; do not fabricate data.

4. Listing detail templates

Category	Suggested category-specific fields
Vehicles	Make, model, trim, year, mileage, transmission, fuel, body type, condition, colour, price, availability.
Property	Property type, location, price, sale/rent status (owner supplied), bedrooms/bathrooms/size and features where provided.
Farm & Produce	Produce/product, unit or pack size, quantity/availability, price, origin/harvest notes if provided.
Electronics	Brand, model, product type, condition, key specs, included accessories, price, availability.
Other Goods	Product name, category, description, price, photos, availability, optional attributes.

5. Owner portal (private admin)

Create a single-owner portal under a subdomain such as portal.yourdomain.com (final domain to be provided). Keep it inside the same codebase/project where practical, but configure deployment so the public storefront and portal can use separate hostnames. The owner signs in to manage the Verimarts catalogue and Journal. There are no seller registrations or public admin links.

Portal sections

- Sign-in: secure Supabase Auth login for the owner, password reset, session expiry, and logout. No public sign-up. Create the owner account through a secure setup step; never hard-code credentials.
- Dashboard: summary counts for published, draft, unavailable/sold listings and writing drafts, with quick links to add content.
- Listings: view/search/filter all records; create, edit, preview, publish/unpublish, mark unavailable/sold, and delete with confirmation.
- Category forms: common fields plus category-specific fields for vehicles, property, farm produce, electronics, and other goods.
- Images: upload multiple images, choose a cover image, reorder/remove images, validate size/type, show previews, and store them in Supabase Storage.
- Journal editor: create and edit articles, title, slug, cover image, category, body, draft/published status, preview, publish/unpublish, and delete.
- Settings: central contact details and basic public business information if the client needs portal editing for them. Protect this data with the same single-admin rules.

6. Backend and access model

Use the existing project’s framework and preserve its current design system. If Supabase is not already configured, use Supabase Auth, Postgres, and Storage. Do not expose the Supabase service-role key in browser code. Use Row Level Security for every table and Storage policy. Public visitors may read published public records; only the authorized owner account may create, edit, publish, or delete data. Ensure no anonymous write policy exists.

Data area	Minimum records/relationships
Categories	Stable category values for vehicles, property, farm-produce, electronics, other-goods, and journal content.

Data area	Minimum records/relationships
Listings	Common fields: id, category, title, slug, description, price/price label, availability, status, featured, location where relevant, timestamps. Category-specific attributes stored in typed columns or validated structured fields.
Listing images	Storage path, listing relation, alt text, display order, and cover-image indicator.
Articles	Title, slug, body, cover image, category, publish date, draft/published status, timestamps. Public read limited to published entries.
Admin profile	Single authorized owner/admin role. Authorization must be enforced by database policies, not hidden UI alone.

7. Deployment and subdomain

Inspect the existing hosting setup first. Keep the current public deployment stable. Implement the portal in the same source project, but plan a separate portal deployment/hostname such as portal.<confirmed-domain>. Reuse the same Supabase project unless there is a documented reason not to. Provide the build configuration, environment variable names, SPA routing/redirect rules, and DNS/domain steps. Do not publish or change DNS without explicit instruction.

8. Implementation sequence

Phase	Work	Done when
A. Inspect and preserve	Audit current code, routes, assets, logo reveal, styles, deployment config, and available catalogue assets.	Plan identifies what remains untouched and how the new work fits.
B. Public content model	Define shared listing/article types, category routes, and a migration-ready data-access layer.	Public UI can read cleanly from the chosen data source.
C. Supabase foundation	Add schema, migrations, auth setup, RLS, storage buckets/policies, and safe environment configuration.	Public read and owner-only write rules are verified.
D. Owner portal	Build login, dashboard, category listing management, image uploads, and Journal editor.	Owner can create, edit, preview, publish, and unpublish content.
E. Connect storefront	Replace sample/local inventory with published Supabase content while preserving the existing visual design.	Published updates appear publicly; drafts remain private.
F. QA and deployment prep	Test mobile/desktop, routes, security, empty states, content errors, and separate host deployment configuration.	Build passes and deploy instructions are documented; nothing is published.

9. MVP acceptance checklist

- Existing logo, colors, loader, layout, and established design are preserved except where new categories require added content/navigation.
- Public category pages and item/article detail pages load correct published content.
- Owner portal is private, has no sign-up route, and only the authorized owner can edit content.
- Each category supports its relevant fields and multiple images without inventing missing details.
- Farm & Produce is prominent in navigation and home-page category discovery.
- Journal supports drafts, preview, publishing, unpublishing, and public reading.
- WhatsApp/phone enquiry works with the correct item context and supplied contact details.
- No multi-vendor features, cart, checkout, online payment, order processing, or reservation system is implemented.
- RLS and storage access are tested; no service-role secret is shipped to the frontend.

- The main storefront and portal can be deployed on separate hostnames from the same project/repository.

10. Required client inputs

Before the portal is connected to production, collect: final domain and hosting access; owner login email; Supabase project credentials for local development; WhatsApp/phone contact; business description and policies; current listings with prices, status, category facts and images; and initial Journal articles with cover images. Keep secrets in local environment variables and hosting environment settings, never in source control.

Important: this document describes a scope and implementation brief. Confirm property terms, inventory, policies, and the public display of owner details with the client before release.

11. Claude Code implementation prompt

Work in the existing Verimarts website repository. Inspect the current files, routes, assets, package scripts, and hosting setup before editing. Preserve the approved logo, red/black/silver palette, existing layout, typography, and logo reveal. Expand the current site into a single-owner marketplace for Cars, Property, Farm & Produce, Electronics, Other Goods, and a public Journal. Keep Farm & Produce prominent. Build a private owner portal in the same project/repository and prepare it for a portal subdomain, using the existing framework and deployment approach where possible. Use Supabase Auth, Postgres, and Storage for the backend. Allow no public signup and no vendor/seller accounts: only the authorized owner can manage listings and writing. Enforce owner-only writes and public reads of published content with database and Storage policies. Give the owner category-specific listing forms, multi-image uploads, draft/publish/unpublish controls, availability status, and a Journal editor. The public site must show published content and send enquiries to the supplied WhatsApp/phone contact. Do not invent inventory, services, policies, business details, or property sale/rental status. Do not add cart, checkout, online payment, reservation, order processing, or multi-vendor features. Keep secrets out of source control and frontend code. Run the available checks, fix errors, and report files changed, required environment variables, client inputs still missing, local run commands, and separate-domain deployment steps. Do not deploy or change DNS.
