PRODUCT DEFINITION AND PAGE MAP

Website MVP Scope

A front-end-only plan for the first Verimarts website release: a polished vehicle showcase that turns browsing into direct enquiries.

MVP definition

Build a responsive public website that presents Verimarts, lets visitors browse and filter a sample vehicle catalogue, shows a detailed page for each vehicle, and routes interested buyers to WhatsApp or phone. Vehicle content is static/local for the MVP and can be replaced with Supabase or another backend later.

No backend. No cart. No checkout. No order creation. “Enquire about this vehicle” opens a direct conversation with the business.

1. Site map

Page	Purpose	Key content and actions
Home	Introduce the brand and direct visitors into inventory.	Hero, featured vehicles, browse categories, trust points, enquiry CTA.
Showroom / Inventory	Browse all listed vehicles.	Search, category filters, sort, listing cards, availability labels.
Vehicle detail	Help a buyer evaluate one vehicle.	Gallery, price, specifications, condition notes, WhatsApp enquiry.
About Verimarts	Explain the business in plain, credible language.	Who the business serves, approach, verified location/contact.
Services	Describe only confirmed services.	Vehicle sales plus confirmed sourcing/inspection/other services.
Contact	Offer direct ways to reach or visit the business.	WhatsApp, phone, email, location/hours if supplied.

2. Homepage sections

- Header: logo, navigation, clear “Browse cars” action; responsive mobile menu.
- Hero: concise value statement, automotive imagery, primary showroom CTA, secondary WhatsApp contact.

- Featured inventory: a small curated set of vehicles, each with photo, make/model, year, price, and availability.
- Browse by category: useful categories only (for example SUV, sedan, pickup, or bus) based on actual stock.
- Why Verimarts: short, verifiable reasons to enquire; no fabricated guarantees.
- How it works: browse, review details, message the team, arrange next steps directly.
- Services preview: show only services confirmed by the client.
- Closing contact band and footer: WhatsApp CTA, contact details, navigation, social links if provided.

3. Inventory showcase and vehicle cards

Each vehicle card should show a strong lead image, make/model, year, price (or “Contact for price” if approved), mileage, transmission, fuel type, and a clear status such as Available or Sold. Use consistent image proportions and avoid showing a sold car as currently available. Card actions: “View details” and, optionally, “WhatsApp enquiry.”

4. Vehicle detail page

- Gallery: main image, thumbnails, keyboard/touch-friendly controls, descriptive alt text.
- Summary: title, year, price, stock status, and a short accurate description.
- Specifications: make, model, trim, year, mileage, transmission, fuel, body type, drivetrain, exterior/interior colour, and condition notes when known.
- Enquiry action: WhatsApp button opens a prefilled message naming the vehicle; include a phone-call option when a number is supplied.
- Related vehicles: optional section from the same local catalogue data.

Do not present enquiry as reservation, purchase, or confirmed order. The page should explain that availability and transaction details are confirmed directly with the business.

5. Showroom search and filters

All filtering runs in the browser against the local vehicle data. Initial filters should be limited to useful attributes that the client can keep accurate: make, body type, price range, year, transmission, and availability. Include a sort option such as newest listed, price low-to-high, or year. Provide a clear “Reset filters” control and an empty state with a WhatsApp/contact route.

6. About, Services, and Contact

About: establish who Verimarts is and its customer focus; avoid invented history or credentials. Services: launch with vehicle sales. Add vehicle sourcing, inspection coordination, delivery, trade-ins, or finance guidance only if the client confirms each one. Contact: show WhatsApp, telephone, email, address, service hours, and map link only when verified.

7. Cart, orders, and payments: explicit MVP decision

There is no cart or ordering system in this release. Visitors do not add vehicles to a basket, reserve stock, pay deposits, or submit a purchase order. Use enquiry language instead: “Ask about this car,” “Chat on WhatsApp,” or “Call to confirm availability.” If desired, a non-persistent shortlist/favourites feature can be considered separately; it must not imply reservation or purchase.

8. Front-end implementation requirements

- Responsive layouts for mobile, tablet, and desktop; accessible navigation and visible focus states.

- Static/local structured vehicle data, separated from UI components so a future API can replace it.
- Reusable components for vehicle cards, filters, galleries, badges, and WhatsApp links.
- Working client-side search/filter/sort and functional page navigation.
- SEO basics: page titles, descriptions, semantic headings, social preview metadata, and vehicle image alt text.
- Performance: optimized responsive images, lazy loading below the fold, restrained motion, and reduced-motion support.
- Consistent visual use of racing red #FF0000, black #000000, and silver grey #C0C0C0.

9. Content and assets needed from the client

Needed	Minimum input
Business identity	Approved logo files, exact business name, short description, location/service area.
Contact details	WhatsApp number in international format, phone/email, hours, social links.
Vehicle inventory	Vehicle name, year, price policy, availability, specs, condition notes.
Vehicle photography	Clear exterior/interior images with permission to publish.
Services and policies	Confirmed services, inspection/test-drive process, privacy/contact wording.

10. MVP acceptance checklist

- A visitor can understand what Verimarts offers from the homepage.
- A visitor can browse, search, filter, and sort the catalogue without a server.
- Each vehicle has a readable detail page with images, specs, price policy, and status.
- WhatsApp links open the correct chat with a useful prefilled enquiry; phone links work on mobile.
- No UI copy suggests that the site takes orders, accepts payment, or reserves inventory.
- Navigation, responsive behavior, accessibility basics, and loading performance are checked on mobile and desktop.
- The inventory source is structured for a future backend migration.

11. Later phase (not part of this MVP)

Potential later additions include Supabase inventory management, secure admin login, enquiry/lead tracking, persistent favourites, availability workflows, customer accounts, appointment booking, and payments. These require separate requirements, security decisions, operational processes, and testing before implementation.

Build sequence

1) Confirm content and contact details → 2) create responsive shell and homepage → 3) implement static showroom data and filters → 4) build vehicle details and direct enquiry links → 5) add About/Services/Contact → 6) test content, mobile behavior, accessibility, and performance.
